PRESS RELEASE

Bausch+Ströbel at FachPack 2019

Versatile solutions for small-scale pharma production

Bioengineered medicines are becoming increasingly important. This is a trend that is presenting entirely new challenges not only for the pharmaceutical industry, but also for manufacturers of filling and packaging machines.

For many years, the fast and cost-effective production of large volumes of common drugs such as insulin or vaccines was the top priority. Today, however, there is a growing demand for machines that are able to process small batches as efficiently as possible. This is why, in addition to fully automatic high-volume systems, which are of course still in demand on the pharmaceutical market, more and more drug manufacturers are now on the lookout for small and versatile filling and packaging systems.

Packaging specialist Bausch+Ströbel will present its solutions for small-scale pharma production at the FachPack in Nuremberg. The systems on display are the smallest touchscreen-operated semi-automatic filling and packaging machines suitable for use in isolators. They are specially designed to withstand the rigors of vapor-phase hydrogen peroxide (VPHP) decontamination.

Because of this, these systems are also the ideal complement to the versatile VarioSys production system, which allows a standardized isolator to be combined with a wide variety of machine modules. Furthermore, multiple modules can easily be linked together to create a production line and supplemented with additional options such as freeze-dryers and rinsing machines.

New digital solutions will also be on the agenda in Nuremberg. Using the table-top machines on display, Bausch+Ströbel will show how augmented reality can be utilized to enhance every aspect of the customer's production process from operator training to servicing. FachPack also provides the perfect platform to showcase the wide range of services that B+S offers its customers - from pharma services and digital engineering to parts management.
